Propellant -

Propellants are responsible for developing the pressure in the aerosols container and also it expel the product from the container when the valve is opened and helps in expelling the product by atomization of contents or by causing foam production of the product, when propellant is a liquefied gas or a mixture of liquefied gases, it frequently serves the propellant and solvent or vehicle for the product concentrate.

Types of propellant -

Depending on the route of administration and use, the propellant can be classified as -

1) Type-I propellant A -
liquefied gas

(fluorinated hydrocarbons) -

Solid state.

Crystal system -

Most pharmaceutical solid have crystals in size range 50-300 μm . In the design of dosage form, crystalline materials are preferred in some cases, while they are not recommended in certain areas. Most solids exist in crystalline state.

Crystallinity is defined as co-ordination of matter resulting from an orderly cohesive 3D arrangement of its component particle in space.

3D arrangement is called as crystal lattice or space lattice.

In pictorial representation, points indicate position of particles. The position occupied by particles are called lattice sites or lattice points.

The angle between the two perpendiculars to the two intersecting faces is termed as 'Interfacial angle'.

In crystals, the crystal lattices are represented several times.

The smallest geometrical portion of the crystal, which is repetitive unit to build up the whole crystal is called as 'unit cell'.

The angles between the unit cell edges are small as interfacial angles.

Bravais Lattice system -

Crystal assume a number of geometric structure. The 3D system may be represented by x, y and z axes. To characterise them, the following parameters are considered.

The length of unit size edges a, b, c.

Angle between the unit cell edges α, β, γ
 Based on these parameters, crystals may have innumerable geometric structure
 No. of geometric structure - 2300
 No. of type of space lattice - 14
 No. of crystal system - 7

For drugs there are only three common type of unit cells, triclinic, monoclinic, or the rhombic.

- 1) Cubic eg NaCl, KCl
 $\alpha = \beta = \gamma = 90^\circ$
- 2) Tetragonal eg urea
 $\alpha = \beta = \gamma = 90^\circ$
- 3) Hexagonal eg Ice, crystal thymol
 $\alpha = \beta = 120^\circ, \gamma = 120^\circ$
- 4) Rhombohedral eg Barium sulphate
 $\alpha = \beta = \gamma \neq 90^\circ, a = b = c$
- 5) Orthorhombic
 $\alpha = \beta = \gamma = 90^\circ, a \neq b \neq c$
- 6) Monoclinic eg sucrose
 $\alpha = \beta = 90^\circ, \gamma \neq 90^\circ$
- 7) Triclinic eg phenolphthalein, CuSO_4
 $\alpha \neq \beta \neq \gamma \neq 90^\circ, a \neq b \neq c$

Crystal Habit -

The crystal of a given substance may vary in size, relative development of faces, no. of faces and the kind of faces present. These terms are termed as 'crystal habit'.

Crystal habit is description of appearance of crystal.

Many drug can exist in more than one crystalline form. Crystal habit influence the following ways:-

[Signature]
 PRINCIPAL
 VISHAL INSTITUTE OF PHARMACEUTICAL
 EDUCATION AND RESEARCH
 ALE TAL-JUNNAR DIST-PUNE 412411

- a) The ability to to inject a suspension using a syringe needle. Plate like crystal are easier to inject than that of needle like crystal.
- b) The flow of properties and ease compression. The habit of crystal depends on the conditions of crystallization such as solvent used, temp, conc, presence of impurities in solution.
- 1) Superstition tends to transform a prism or or granule to needle shape
 - 2) cooling rate and agitation is effective in changing habit, since it changes the degree of supersaturation.
 - 3) The crystalline solvent affects habits by preferential absorption on the certain faces there by inhibiting their growth
- a) Addition of cosolvent, other solutes and ions may change habit by poisoning the crystal growth in one or more direction. Sodium chloride is usually cubic, but urea cause sodium chloride crystal to have an octahedral habit.

Solution of Electrolyte & Nonelectrolyte

1) percentage by mass -

It is defined as "the number of grams of Solute present in 100gm of solution". Eg. A 20% solution of NaOH by weight contains 20 parts by mass of NaOH by dissolved in 80 parts by mass of water. Generally this unit is used to prepare solution of appropriate concentration.

2) Normality (N) -

Normality is the number of gram equivalents of solute present in 1000 ml of solution. Normality is represented by symbol 'N'.

$$\text{Normality (N)} = \frac{\text{Gram equivalent of solute}}{1000 \text{ ml of solution}}$$

3) Molarity (M)

Molarity is defined as Moles (gm molecular weight) of solute in 1 litre of solution.

$$\text{Molarity } M = \frac{\text{Moles of solute}}{\text{Litres of solution}}$$

4) Molality (m)

Molality is a conc. unit based on the number of moles of solute per kilogram of solvent.

Q.1 (a) BBB — (Blood Brain Barrier)

Diagram -

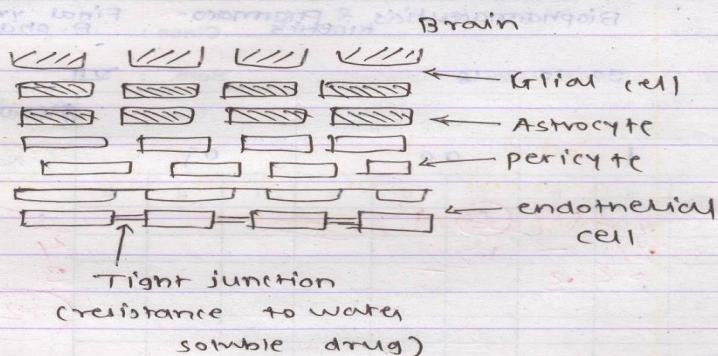

Fig. BBB.

(i) Blood brain barrier is composed of —

- (a) astrocyte.
- (b) pericyte.
- (c) endothelial cell.

(ii) water soluble drug generally cannot cross the BBB.

(iii) In endothelial cell tight junction are present.

(iv) Highly lipophilic drug molecule can cross the BBB.

(v) mainly mol. wt. less than 500 dalton it. 400-500 can cross BBB.

(vi) Astrocyte & pericyte essential component of BBB.

(vii) BBB it is barrier to entrance the drug into it. these are most imp. Factor which can affect the drug distribution.

b Volume of Distribution

It is not a real meaning but it is different cell of body cannot be equilibrated.

It is indicated as (V_d) It is direct relationship between Amount of drug in body to conc. of drug in plasma.

$$X = V_d C$$

V_d is proportionality constant.

It is apparent Volume of fluid to drug dissolved.

$$V_d = \frac{X}{C}$$

$$\therefore V_d = \frac{X}{C}$$

Volume of distribution it is ratio of amount drug in body to conc. of drug in plasma.

(d) Biotransformation — It is conversion of one form to another by enzymatically. it is also known as metabolism.

Liver is metabolising organ it is also called hepatic metabolism. the metabolism / Biotransformation other than liver known as Extrahepatic metabolism.

metabolising enzyme. It is used metabolised Xenobiotics

(1) microsomal enzyme.

(2) non-microsomal enzyme.

(1) microsomal enzyme — It is present in Endoplasmic reticulum it binds with drug / interrupt with drug and Formation of 2^o metabolites.

(2) non-microsomal enzyme —

It is present in cytosol of cell it interrupted with drug and Formation of 2^o metabolites.

Equation becomes,

$$\therefore \frac{dc}{dt} = \frac{V_{max} c}{k_m + c} \quad (1)$$

kinetic equation's -

(1) where $k_m = c$

$$\therefore \frac{dc}{dt} = \frac{V_{max} c}{k_m + c}$$

$$\frac{dc}{dt} = \frac{V_{max} c}{c + c}$$

$$\frac{dc}{dt} = \frac{V_{max} c}{2c}$$

② pH-partition Hypothesis

In pH partition Hypothesis there are two essential factors are included i.e.,

- ① lipophilicity of Drug.
- ② pK_a of Drug.

In hypothesis several generalisation may occur,

① For acid -

- (i) Very weak $pK_a > 8$
- (ii) moderately $2.5 - 7.5$
- (iii) strong acid $pK_a < 2.5$

② For Base

- (i) Very weak, $pK_a < 5$
- (ii) moderate, $pK_a = 5 - 11$
- (iii) strong base $pK_a > 11$

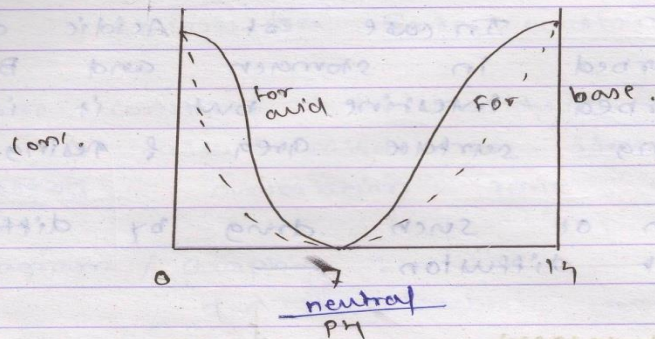

pK_a is generally depend upon pH.

There are following limitation arises at hypothesis

- ① as virtual pH
- ② dissolution of ionised Drug.

① Virtual pH — as the following graph is plotted drug conc. vs pH. In GIT mainly unionised drug can be absorbed.

curve is obtained with a left side of curve indicates as it is for acidic component as pH 0-7. While right side shaped curve shows for basic component, as pH > 7. As the pH is greater than pH_a then pH_a is reduced, while pH_a is greater than pH, while pH reduced that an inverse relation as pH increases pH_a decreases. Vice versa.

$$\underline{pH \uparrow = pK_a \downarrow}$$

(2) Dissolution of Ionised Drug —

In GI only unionised drug can be absorbed, but in case of ionised drug is absorbed but slowly as compared to unionised drug. Unionised drug 3-4 times greater absorbed as compared to ionised drug.

In case of Acidic drug ~~into~~ not absorbed in stomach and Basic drug not absorbed intestine, but it is absorbed by increasing surface area & increasing residence time.

Absorption of such drug by different method of diffusion —

- (a) pore transport.
 - (b) Ion-pair transport.
 - (c) carrier mediated transport.
- } Ionised drug.

while unionised drug can be absorbed by diffusion processes, but ionised drug can be absorbed by pore transport, Ion-pair transport and carrier-mediated transport.

Ex. 3

(b) Absorption Rate A constant :-

rate constant is residual method. It is also called as stripping or peeling method. Absorption rate can be determined

Diagram / Graph :-

When drug is absorbed to extravascular adminⁿ. In above graph is plotted $\log C$ against $\log C$ vs t

where, $\log C =$ Actual conc.
 $\log Cr =$ residual conc.

$\leftarrow C =$ it's backward / extrapolated conc.

$$C = \frac{K_a F x_0}{V_d (k_a - k_e)} \cdot (e^{-k_e t} - e^{-k_a t})$$

where, $\frac{K_a F x_0}{V_d (k_a - k_e)} =$ hybrid constant $= A$

VISHAL INSTITUTE OF PHARMACEUTICAL
EDUCATION AND RESEARCH
ALE TAL-JUNNAR DIST-PUNE 412411

$$\therefore C = A(e^{-k_{el}t} - e^{-k_{at}t})$$

$$C = A e^{-k_{el}t} - A e^{-k_{at}t} \quad (1)$$

For extravascular administration,

$$C_r = A e^{-k_{el}t} \quad (2)$$

For the residual conc. $\bar{C}$

$$\bar{C} = C_r - C$$

$$\bar{C} = A e^{-k_{el}t} - (A e^{-k_{el}t} - A e^{-k_{at}t}) \quad \text{eqn (1) + eqn (2)}$$

$$\bar{C} = A e^{-k_{at}t} \quad (3)$$

$$\log \bar{C} = \log A + \frac{k_a}{2.303} t$$

$\therefore$ Taking log of both side
comparing eqn with $y = mx + c$

$$C_r = A e^{-k_{el}t}$$

eqn

log both sides

$$\log C_r = \log A + \frac{k_{el}}{2.303} t$$

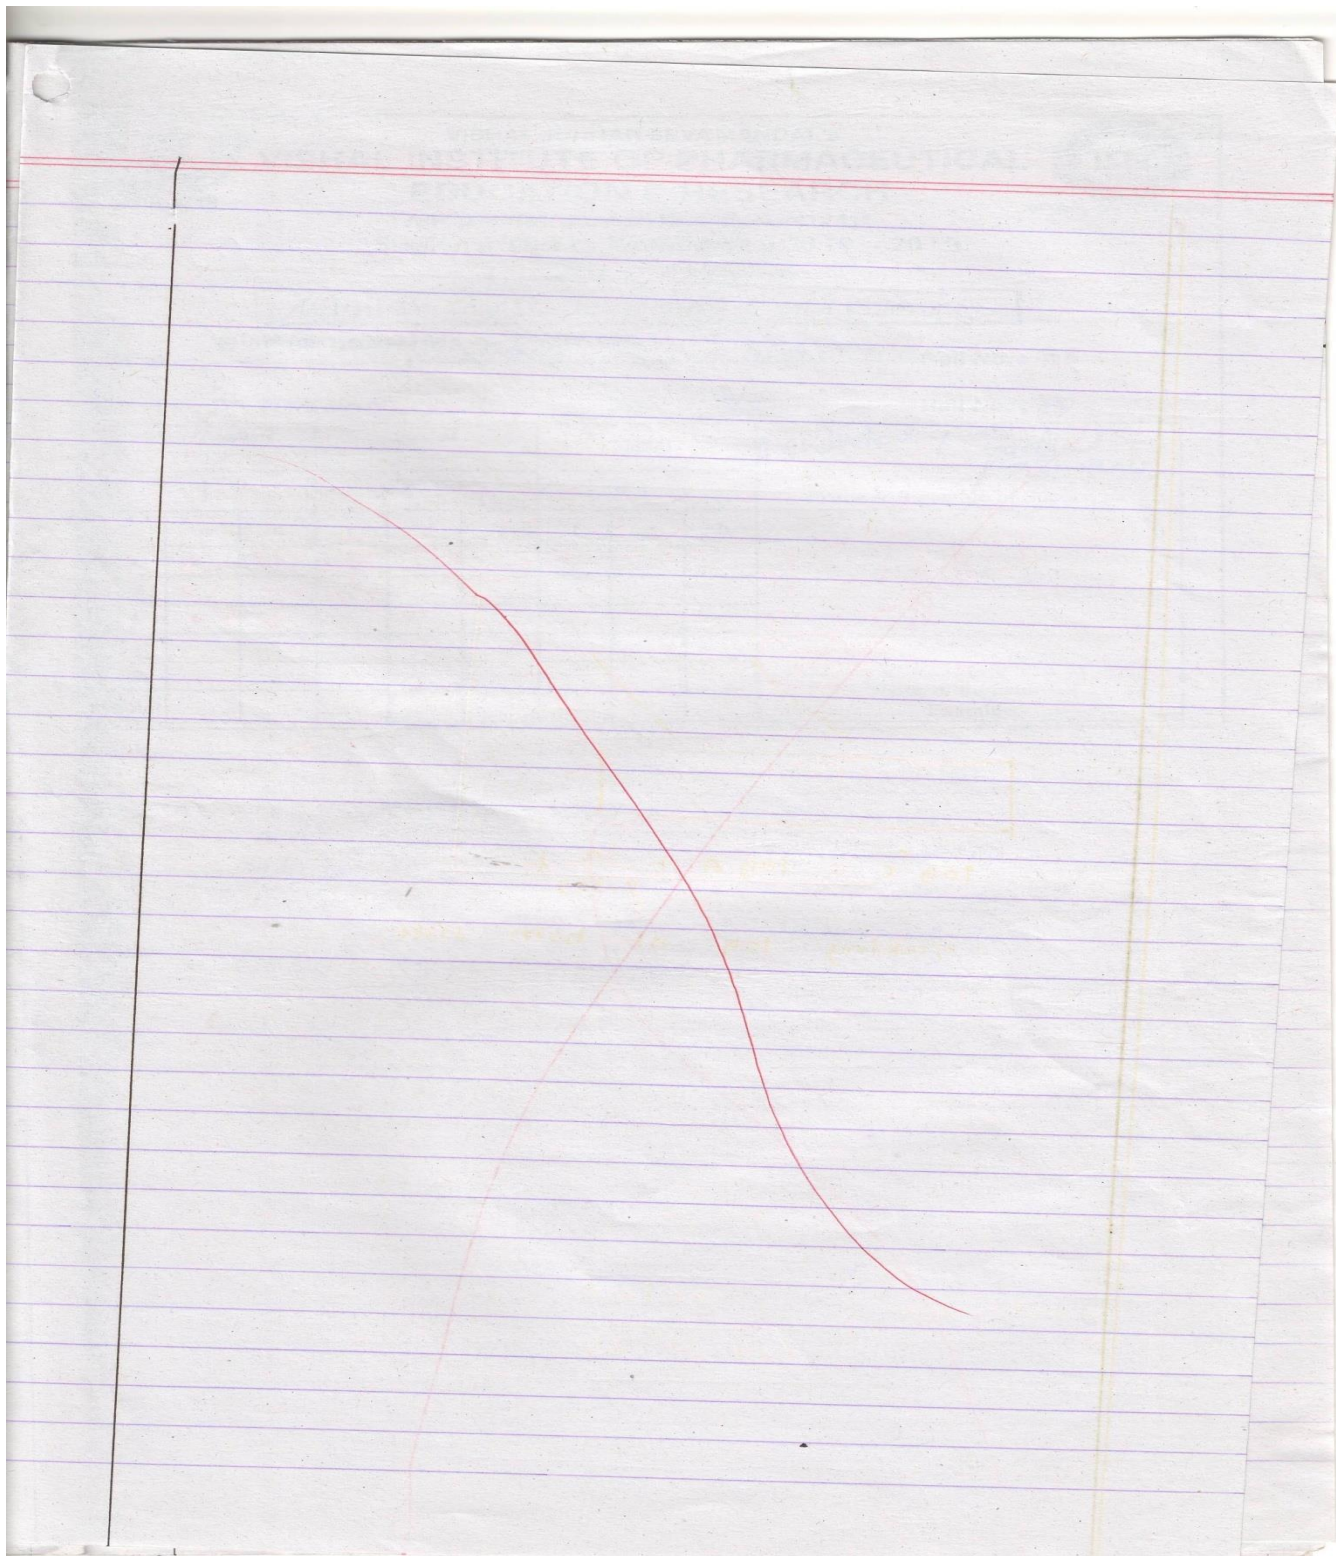

it is above eqn compare with,

$$y = mx + c$$

- 4) Angle of repose.
- 5) Disintegration test.
- 6) Weight Variation test.
- 7) Content Uniformity test.
- 8) Dissolution test.

1) Bulk density :-

It is check for the flow property.

Bulk density :- $\frac{\text{Mass of sample}}{\text{Bulk volume.}}$

2) Tapped density :-

It is calculated by -

Tapped density = $\frac{\text{Mass of sample}}{\text{Tapped volume.}}$

3) Particle / Powder compressibility :-

In that involves the Hausner's ratio and compressibility index using formula.

compressibility index :-

$$\frac{\text{Tapped Density} - \text{Bulk density}}{\text{Tapped Density}} \times 100$$

Hausner's ratio :-

$$\frac{\text{Tapped density}}{\text{Bulk density}}$$

4) Weight variation test :-

1. Weight the each tablet separately. (upto 10 tablet).
2. Then take average of the 10 tablet.
3. And then match the average with weight of single tablet.

2 ✓

Sr. No.	% of average	% of availability of tablet.

Dear sir/madam,

one of our M.Pharm (2019 pattern) student failed in one subject in Oct 2020 exam. She filled exam form for that subject for May 2021 exam.

But that subject is not present in summary as well as hall ticket. So we added that subject in her hall ticket through online hall ticket correction system.

We also completed her internal mark entry through additional students mark entry.

But she could not give online exam for that subject. Help line number said that she might be pass in that subject and do check updated result ledger.

As per updated ledger she has passed that subject. But she has got sms from SPPU that your exam is scheduled on 08/09/2021.

Kindly guide for the same.

Respected Sir,

One of our F.Y.B.Pharm. student WAJAGE RUTUJA PANDURANG has created 2 profiles.

1. rutupwajage@gmail.com
2. rutuja.wajage@gmail.com

She had spelling mistake in her name in profile with 1st mail id . After creating new registration with 2nd mail id, AADHAR number is showing already linked to another profile.

So we kindly request you to **delete both of above profiles from database**, so that we can recreate new profile and use same AADHAR id for the same.
